

Arrow - Fix

The Solution for the Repair of Wooden Arrows

Arrow-Fix is a tool-kit for the precise and reliable repair of wooden arrows.

- ➔ A glued outer cone shape perfectly fits into a tapered hole; forms a strong conical joint which is resistant to damage and only visible to 1/25th of an inch.
- ➔ Repairs can be made from the tip of the arrow up to the fletching. The time spent and the glue used at the repair bench is minimal. Year long testings prove that Arrow-Fix produces fast and durable repair joints for arrows of several wood types including bamboo.
- ➔ Arrow-Fix is many tools in one, yet can be selectively ordered with individual components for one's needs.
 - ➔ A taper-tool for 5° field points and nocks for shafts: 5/16, 11/32, & 23/64.
 - ➔ A conical drill for tapered 5° bores for the above three shaft diameters.
 - ➔ A V-block support for exact set up and fixing of the glued repair section.
 - ➔ A cylindric drill bit for inserting a shaft thorn tip, which is an all in one tip with a long shaft. Once glued into the shaft, it offers the arrow stability by changing the point of lowest resistance, thus drastically reducing the risk of breakage.
- ➔ The main body and interchangeable adapters are milled from high quality aluminum. The cutting blades are constructed from high performance HSS tool steel of German standards.
